The invention relates to a novel method for vaccinating an individual against stratum corneum chymotrytic enzyme (SCCE), comprising inoculating an individual with a SCCE peptide, which elicits an immune response in the individual with a SCCE peptide, which elicits an immune response in the individual. A peptide of the invention acts as a stratum corneum chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or peptides are also useful in the monitoring and development of immunotherapies for ovarian and other malignancies. The present sequence represents a peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of stratum corneum chymotrytic enzyme (SCCB) peptides, for vaccinating an individual against SCCB, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human stratum corneum chymotrytic enzyme peptide fragment SEQ ID NO:31.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                   The invention relates to a novel method for vaccinating an individual against stratum corneum chymotrytic enzyme (SCCE), comprising inoculating an individual with a SCCE peptide, which elicits an immune response in the individual. A peptide of the invention acts as a stratum corneum chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligomucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or peptides are also useful in the monitoring and development of immunocherapies for ovarian and other malignancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum
                                                                                                      Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human stratum corneum chymotrytic enzyme peptide fragment SEQ ID NO:109.

                                                                                                                                                            against stratum corneum chymotrytic enzyme (SCCE), comprising incentating an individual with a SCCE peptide, which elicits an immune response in the individual with a SCCE peptide, which elicits an immune response in chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or pancreatic cancer, and other cancers in which SCCE is overexpressed. The peptides are also useful in the monitoring and development of immunotherapies for ovarian and other malignancies. The present sequence
vaccinating an individual against SCCE, and in monitoring and developing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes NoVX proteins, where X can be 1 to 55

(e.g. NOVI). Also described: (1) a composition comprising a polypeptide

coefficial above and a carrier; (2) a kit comprising, in one or more

containers, the composition described above; (3) an isolated nucleic acid

comprising the nucleic acid molecule described above; (5) a cell

comprising the nucleic acid molecule described above; (5) a cell

comprising the nucleic acid molecule described above; (7) methods for determining the

presence or amount of the above polypeptide or nucleic acid molecule in a

sample; (8) methods for determining the presence of or predisposition to

a disease associated with altered lavels of expression of the above

co a disease associated with altered lavels of expression of the above

polypeptide or nucleic acid molecule in a first mammalian subject; (9) a

method of identifying an agent that binds to the polypeptide described

above; (10) a method for identifying a potential therapeutic agent for

use in treating a pathology that is related to an aberrant expression or

aberrant physiological interactions of the polypeptide (11) a method of

screening for a modulator of activity or of latency or predisposition to

c a pathology associated with the polypeptide; (11) a method of

cor preventing a pathology associated above; (13) methods of treating

cor preventing a pathology associated with the above polypeptide. NoVX

sequences have antidiabetic, anorectic, antibacterial, virucide,

immunomodulator, cytostatic, noorpoic, neuroprotective, antiparkinsonian

c mammal; and (14) a method for producing the above polypeptide in an aderiance or preventing a method for producing the above polypeptide or the nucleic

and antilipaemic activities, and can be used in gene therapy. The

polypeptide is useful in manufacturing a medicament for treating and antilipaemic activities, and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       on G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X; ajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton E; Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; ts RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo VA; AJ, Gangolli EA, Rieger DK, Spaderna SK;

The invention relates to isolated NoVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the abstrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and cartivity of NOVX by supplementing the patient our expression or activity of NOVX by supplementing the patient our production or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polynucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX.

Caponists and antagonists) of the expression and activity of NOVX polypeptides and antibodies, agonists and antagonists may also be used as diagnostic agents for detecting the presence of NOVX polypeptides and polynucleotide expression and activity of novX polypeptides and polynucleotides may be used all in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disease, anorexia, cancer, cancer-associated cachexia, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, haematopoietic disorders, and the various dyslipidaemias, metabolic disturbances associated with obseity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        They may also be used as antibacterial agents. The present represents the amino acid sequence of a human NOVX protein.
Claim 1; SEQ ID NO 100; 395pp; English.

```
The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of [II]. The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed consists of [I] is useful in gene therapy techniques to restore normal activity of [II] or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cuplypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders cupylypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations collypeptide and polymucleotide sequences have applications in diagnostics, forgensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from Wipp at the printed specification, but was obtained in celectronic format directly from Wipp or contacts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Production of activated immune cells or dendritic cells by exposing immune cells to tumor antigen derived gene protein fragment consisting of amino acid sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              dendritic cells directed toward extracellular serine protease termed tumour antigen derived gene-14 (TADG-14). The method of the invention involves exposing the immune cells to a TADG-14 protein fragment, where exposure to the TADG-14 protein fragment activates the immune cells. The invention is used for the production of activated immune T cells or invention is used for the production of activated immune T cells or dendritic cells. The invention allows screening to identify proteases overexpressed in carcinoma. The present sequence is stratum corneum chymotryptic enzyme (scce) catalytic domain. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel activated immune T cells or

The invention relates to extracellular serine protease termed tumour antigen derived gene-14 (TADG-14) and its nuclaic acid. Composition composition an entity of derived gene-14 peptide is useful for treating a neoplastic state in an individual. The neoplastic state is chosen from ovarian cancer, breast cancer, injung cancer, colon cancer, prostate cancer in which TADG-14 is overexpressed. The present sequence is Stratum corneum chymotryptic enzyme (scce) catalytic domain. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated DNA encoding tumor antigen derived gene-14 protein, useful for treating neoplastic state (such as ovarian cancer, breast cancer, lung cancer, colon cancer, prostate cancer) in an individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunomodulator; cytostatic; nootropic; neuroprotective;

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the nucleic acid molecule described above; (5) a call
comprising the above vector; (6) an antibody that immunospecifically
binds to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
a disease associated with altered levels of expression of the above
polypeptide or nucleic acid molecule in a first mammalian subject; (9) a
method of identifying an agent that binds to the polypeptide described
above; (10) a method for identifying a potential therapeutic agent for
use in treating a pathology that is related to an aberrant expression or
aborrant physiological interactions of the polypeptide; (11) a method of
correct a madulator of activity or of latency or predisposition to
a pathology associated with the polypeptide; (12) a method for modulating
cor preventing a pathology sesociated with the above polypeptide. Novx
mammal; and (14) a method for producing the above polypeptide in a
mammal; and (14) a method for producing the above polypeptide in a
mammal; and antiliabentic, anorectic, anorectic, antibacterial, virucide,
immunomodulator, cytostatic, nootropic, neuroprotective, antiparkinsonian
correct and antiliabent and an be used in gene therapy. The
polypeptide is useful in manufacturing a medicament for treating a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X, Paturajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; Ort T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton E, Ji W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; Shimkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo VA; Eisen AJ, Gangolli EA, Rieger DK, Spaderna SK;

human; NOVX; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer-associated cachexia; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia; metabolic syndrome X;
syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dystlipidaemias. The nucleic acids can also be used as Mybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the

The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the abserrant expression and activity of NOVX by supplementing the patient our polynucleotides may be used to treat disorders associated with decreased polynucleotides may be used to treat disorders associated with decreased conduction or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NoVX polypeptides by binding with the cells own genes and preventing their expression. NoVX polynucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NoVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators anti-NoVX polypeptide antibodies, agonists and antagonists may also be used to modulate NoVX polypundleotide expression and activity of NoVX. Dolypeptides and polynucleotide expression and activity of NoVX polypeptides. The anti-NoVX polypeptide antibodies, agonists may also be used as diagnostic agents for detecting the presence of NoVX in samples. NoVX polypeptides and polynucleotides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Smithson G, Millet I, Peyman on, Shithson G, Millet I, Bengar SR, Ellerman n, Catterto Ort T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterto Ort T, Gorman L, Zerhusen BD, Anderson DW, Pena CEA, Shenoy SG, Ji W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG, Ji W, Miller CE, Rastelli L, Leach MD, Agee ML, Berghs C, Dij Shimkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dij Shimkets RA, Rothenberg ME, Leach MD, Agee ML,

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; in one or more molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a call comprising the nucleic acid molecule described above; (5) a call comprising the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for a boyreptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aborrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating or preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a mammal; and antilipaemic activities, and can be used in gene therapy. The immunomodulator, cytostatic, noctopic, neuroprotective, antiparkinsonian and matilipaemic activities, and can be used in gene therapy. The colypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation

Human NOV18g protein SEQ ID NO:104.

```
The invention relates to isolated NoVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or creat a medical condition in human related to the abbrrant expression and activity of NoVX polypeptides are example, NoVX polypeptides and activity of NoVX polypeptides. For example, NoVX polypeptides and polymucleotides may be used to treat disorders associated with decreased expression or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NoVX polypeptides by binding with the cells own genes and preventing their expression. NoVX binding with the cells own genes and preventing their expression. NoVX polypeptides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of the production of antibodies and in assays to identify modulators capcing and antagonists and antagonists and antagonists and in assays to identify of NoVX. The used to modulate NoVX polypeptide antibodies, agonists and activity of NoVX polypeptides and polymucleotide expression and activity of NoVX polypeptides and polymucleotide may be used in this way to prevent, capcing and the presence of NoVX in samples. NoVX polypeptides and polymucleotides may be used in this way to prevent, diagnose and treat: metabolic disorders, inmune disorders, disorders, and the various dyslipidaemias, metabolic disorders, hammatopoietic disorders, and the various dyslipidaemias, metabolic disorders, and disturbances associated with obesity, the metabolic syndrome X and cappanents and the various dyslipidaemias, metabolic and antibuted and the various displacement and antibuted and antibuted and antibut
                                                                                                                                                                                                                                                     Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X, Patturajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; Ort T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton E; Nastelli L, Stone DJ, Pena CEA, Shenoy SG; Shinkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo Eisen A, Gangolli EA, Rieger DK, Spaderna SK;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              represents the amino acid sequence of a human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         They may also be used as antibacterial agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; SEQ ID NO 96; 395pp; English.

Gaps

The present sequence

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics

Claim 1, Page 172; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell

comprising the above vector; 16) an animosperited for determining the binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above con a disease associated with altered levels of expression of the above con polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential activity or of latency or predisposition to consider a pathology associated with the polypeptide; (11) a method of modulating the activity of the polypeptide described above; (13) methods of treating considers are activity of the polypeptide described above; (13) methods of treating the activity of the polypeptide described above; (13) methods of treating considers have antidiabetic, anorectic, antibacterial, virucide, nown and antilipaemic activities, and can be used in gene therapy. The collypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic configueacy immune disorders such as diabetes or obesity, infections, cancer, neurodegenerative disorders, haematopoletic disorders and various colleease; immune disorders, haematopoletic disorders and various colleease; in chromosome mapping, tissue typing, preventive medicine and proper incompanies. The present sequence represents a human NOVX from the comprising the above vector; (6) an antibody that immunospecifically present invention

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

          residues with aromatic side chains in the PI position. SCCE claves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-|-Tyr-26, and 26-Tyr-|-Thr-27, Could play a role in the activation of precursors to inflammatory cytokines.

TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Very low levels are also seen in the brain and kidney.

SIMILARITY: Belongs to the peptidase SI family. Kallikrein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
 shedding of cells from the skin surface. Specific for amino acid

Sequence 109, Application US/09918243

Patent No. 6627403

GENERAL INFORMATION

GENERAL INFORMATION

APPLICANT: Cannon, Martin J.

APPLICANT: Cannon, Martin J.

APPLICANT: Santin, Alessandro

TITLE OF INVENTION: Methods for the early diagnosis of ovarian cancer;

FILE REPERENCE: B6223CH/C/D/CIP

CURRENT FILING DATE: 2001-07-30

PRIOR FILING DATE: 2001-07-30

PRIOR FILING DATE: 2001-07-33

NUMBER OF SEQ ID NOS: 136

SEQ ID NO 109

LENGTH: 9
                                                                                                               Sequence 89, Application US/09918243

Sequence 89, Application US/09918243

"Sequence 4, Application US/09027337B

"Patent No. 5972616

"GENERAL INFORMATION:

"APPLICANT: O'Fien, Timothy J.

"APPLICANT: Tanimoto, Hirotoshi

"ITILE OF INVENTION: TADG-15: An Extracellular Serine Protease Overexpressed in TITLE OF INVENTION: Breast and Ovarian Carcinomas

"ITILE OF INVENTION: Breast and Ovarian Carcinomas

"TITLE OF INVENTION: Breast and Ovarian Carcinomas

FILE REFERENCE: D664

CURRENT APPLICATION NUMBER: US/09/027,337B

CURRENT FILING DATE: 1998-02-20

NUMBER OF SEQ ID NOS: 13

SEQ ID NO 4

LENGH: 225
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           OTHER INFORMATION: Serine protease catalytic domain of Scce homologous to OTHER INFORMATION: similar domain in TADG-15

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           US-08-557-146-2

i Sequence 2, Application US/08551146

i Sequence 2, Application US/08551146

i Patent No. S834309

i GENERAL INFORMATION:

APPLICANT: Egelrud, Torbjorn

APPLICANT: Hanson, Lennart

TITLE OF INVENTION: Recombinant Stratum Corneum Chymotryptic

TITLE OF INVENTION: Brzyme (SCCE)

NUMBER OF SEQUENCES: 17

CORRESPONDENCE ADDRESS:

ADDRESSER: White & Case, Patent Department

STREET: 1155 Avenue of the Americas

CITY: New York

STATE: New York

STATE: New York

STATE: New York
    Sequence 4. Application US/09654600A

| Patent No. 6649741
| GENERAL INFORMATION:
| APPLICANT: O'Brimen, Timothy J. APPLICANT: Tanimoto, Hirotoshi;
| TITLE OF INVENTION: TANG-15: AN Extracellular Serine Protease;
| TITLE OF INVENTION: Overexpressed in Carcinomas;
| TITLE OF INVENTION: Overexpressed in Carcinomas;
| FILE REPERENCE: 18664CIP/D |
| CURRENT PILING DATE: 2000-09-01 |
| PRIOR APPLICATION NUMBER: 09/421,213 |
| 09/027,337 |
| PRIOR FILING DATE: 1999-10-20 |
| 1998-02-20 |

Sequence 109, Application US/09905083

Sequence 109, Application US/09905083

Patent No. US20020146708A1

GENERAL INFORMATION:

APPLICANT: O'Brien, Timothy J.

TITLE OF INVENTION: Compositions and Methods for the Early Diagnosis of TITLE OF INVENTION: Ovarian Cancer

TITLE OF INVENTION: Ovarian Cancer

FILE REFERENCE: D6223CIP/C)409905,083

CURRENT APPLICATION NUMBER: US/09/905,083

FRICH REPLIAG DATE: 2001-07-13

PRIOR PILIAG DATE: 2000-02-11

NUMBER OF SEQ ID NOS: 136

SEQ ID NO 109

TYPE: PRI
                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human stratum corneum chymotrypsin enzyme peptide #2 (residues 123-131).

A peptide of the invention acts as a stratum corneum chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or peptides are also useful in the monitoring and development of the peptides are also useful in the monitoring and development of immunocherapies for ovarian and other malignancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum corneum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                  Human stratum corneum chymotrytic enzyme peptide fragment SEQ ID NO:32.

The present invention relates to novel activated immune T cells or dendritic cells directed toward extracellular serine protease termed tumour antigen derived gene-14 (TADG-14). The method of the invention involves exposing the immune cells to a TADG-14 protein fragment, where exposure to the TADG-14 protein fragment activates the immune cells. The invention is used for the production of activated immune T cells or dendritic cells. The invention allows screening to identify proteases overexpressed in carcinoma. The present sequence is stratum corneum chymotryptic enzyme (scce) catalytic domain. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Production of activated immune cells or dendritic cells by exposing immune cells to tumor antigen derived gene protein fragment consisting of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Serine protease; tumour antigen derived gene-14; TADG-14; neoplastic state; cancer; ovary; breast; lung; colon; prostate; chymotryptic enzyme; scce; enzyme.

The invention relates to extracellular serine protease termed tumour antigen derived gene-14 (TADG-14) and its nucleic acid. Composition comprising TADG-14 peptide is useful for treating a neoplastic state in an individual. The neoplastic state is chosen from ovarian cancer, breast cancer, lung cancer, colon cancer, prostate cancer in which TADG-14 is overexpressed. The present sequence is Stratum corneum chymotryptic enzyme (scce) catalytic domain. This sequence is used in the
                                                                                                                                                                                                                                                                            Novel isolated DNA encoding tumor antigen derived gene-14 protein, useful
                                                                                                                                                                                                                                                                                               for treating neoplastic state (such as ovarian cancer, breast cancer, lung cancer, colon cancer, prostate cancer) in an individual.
                                                                                                                                                                                                                                                                                                                                                   Example 1; SEQ ID NO 4; 46pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         exemplification of the invention.

WPI; 2003-381626/36. N-PSDB; ADA05743. New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 172; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the mucleic acid molecule described above; (5) a cell
comprising the mucleic acid molecule described above; (5) a cell
comprising the above vector; (6) an antibody that immunospecifically
binds to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
a disease associated with altered levels of expression of the above
cc dientifying an agent that binds to the polypeptide described
above; (10) a method for identifying a potential therapeutic agent for
use in treating a pathology that is related to an aberrant expression or
aberrant physiological interactions of the polypeptide; (11) a method of
creening for a modulator of activity or of latency or predisposition to
capathology associated with the polypeptide; (12) a method for modulating
the activity of the polypeptide described above; (13) methods of modulating
the activity of the polypeptide described above; (13) methods of method for producing the above polypeptide; NOVX
cc a pathology associated with the polypeptide; (12) a method for modulating
the activity of the polypeptide associated with the above polypeptide in a
mammania and (14) a method for producing the above polypeptide is useful in manufacturing a medicament for treating a
continue second as diabetes or obesity, infections; cachexia, cancer,
cache manner associated with a human disease. The polypeptide or the nucleic
cache manner and all aborders such as diabetes or obesity, infections; cachexia, cancer;
controlegenerative disorders such as Alzhaimer of alsease or Parkinson's
controle

The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and colynucleotides may be used to treat disorders associated with decreased polynucleotides may be used to treat disorders associated with decreased conduction or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polynucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators can in entionists and antagonists of the expression and activity of NOVX. The anti-NOVX polypeptide expression and activity of NOVX cused to modulate NOVX polypuble expression and activity of NOVX colypeptides. The anti-NOVX polypeptide expression and activity of NOVX colypeptides. The anti-NOVX polypeptide expression and activity of NOVX colypeptides. The anti-NOVX polypeptide expression and activity of NOVX colypeptides and polynucleotide expression and activity of NOVX colypeptides and polynucleotides may be used in this way to prevent, all agences and treat: metabolic disorders, diabetes, observer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X; Patturajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; Oxt T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton E; Ji W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; Shimkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo VA; Eisen A, Gangolli EA, Rieger DK, Spaderna SK;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1; SEQ ID NO 104; 395pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         une present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500). TADG-15 is an extracellular serine protease. It was found that TADG-15 is overexpressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, ovarian cancer.
                                                                                   Gaps
They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein.
                                                                                                                                                                                                                                                                         Human Stratum Corneum Chymotryptic Enzyme, SCCE, catalytic domain.

(e.g. NOV1). Also described to a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule described above; (5) an isolated nucleic acid molecule described above; (5) an isolated nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence. of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or above; (10) a method for identifying a potential therapeutic agent for capthology associated with the polypeptide; (11) a method of screening or a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating cor preventing a pathology associated with the above polypeptide. Novx sequences have antidiabetic, anorectic, antibacterial, virucide, and antilipaemic activities, and correction of the above polypeptide or the nucleic and antilipaemic activities, and energial a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule many be used in mean account many many heaven.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human; NOVX; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer; cancer-associated cachexia; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dynslipidaemia; metabolic syndrome X;
                                                                                                                                                                                                                                                                                                                                                                                                         acid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslighdaemias. The nucleic acids can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the
 present invention describes NOVX proteins, where X can be 1 to 55

Isolated NOVX polypeptides and nucleic acids, useful for preventing,

```
The Invertion Figlaces to isolated wovx polypeptides and polymucleotides are used to the aberrant expression and activity of NoVX polypeptides. For example, NoVX polypeptides and polymucleotides rectivity of NoVX polypeptides and activity of NoVX polypeptides and activity of NoVX polypeptides and polymucleotides may be used to treat disorders associated with decreased expression or activity of NoVX by supplementing the patient our confliction or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NoVX polypeptides by chinding with the cells own genes and preventing their expression. NoVX polymucleotides and complementary sequences may also be used as DNA probables, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of captorative therapy. NoVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NoVX. The cant.-NoVX polypeptide antibodies, agonists and antagonists may also be used as diagnostic agents for detecting the presence of NoVX in samples. NoVX polypeptides and polymucleotide say be used in this way to prevent, cancer agents for detecting the presence of NoVX in samples. NoVX chiefectious disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, haematopoietic disorders and the various dyslipidaemias, metabolic disorders associated with obesity, the metabolic channers associated with obesity. The metabolic capeners and the various dyslipidaemias, metabolic capeners the amino acid sequence of a human NoVX protein.
                                                                                                                         invention relates to isolated NOVX polypeptides and polynucleotides.
   diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease
                                                           Claim 1; SEQ ID NO 102; 395pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 247 AA;

ö

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 169-170; 586pp; English.

The present introducing described boves, [0] a kit composition comprising a polypeptide described above and a carrier; (2) a kit composition comprising a polypeptide described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above copypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for a bove; (10) a method for identifying a potential therapeutic agent for a bove; (10) a method for identifying a potential therapeutic agent for a bathology that is related to an aberrant expression or above; (10) a method for identifying a potential or polypeptide; (11) a method of activity or of attenty or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating cor producing the above polypeptide; NOVX sequences have antidiabetic, anorectic, antibacterial, virucide, immunomodulator, cytostatic, nootropic, neuroprotective, antiparkinsonian cor modulation and neuroprotective, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. The cyntypeptide is useful in manufacturing a medicament for treating a cyndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic The present invention describes NOVX proteins, where X can be 1 to

```
The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or novX polypeptides and polymucleotides are used to treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and conditions associated with decreased polymucleotides may be used to treat disorders associated with decreased conduction or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX polymeticotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of crestorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators anti-NOVX polypeptide antibodies, agonists and antagonists of the expression and activity of NOVX.

Copypeptides. The anti-NOVX polypeptide antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX polypeptides and polymucleotides may be used in this way to prevent, clagnose and treat: metabolic disoders, obesity, infectious disease, anorexia, cancer. cancer-associated cachexia, neurodegenerative disease, parkinson's bisorder, immune disorders, immune disorders, immune disorders, immune disorders, immune disorders, immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; SEQ ID NO 92; 395pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2004-213931/20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB; ADN62895.

disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NoVX from the present invention.
                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                               ö

The present invertion describes Nova proteins, where A can be 1 to 3 by containing a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a Novy protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically brinds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a disease associated with altered levels of expression of the above; (10) a method for identifying a potential theraspettic agent for above; (10) a method for identifying a potential theraspettic agent for above; (10) a method for identifying a related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of activity of the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating cor preventing a pathology that is each above polypeptide. Novx sequences have antidiabetic, anorectic, antibacterial, virucide, and antilipaemic activities, and antidiabetic and endel in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a colypeptide is useful in manufacturing a medicament for treating a colypeptide is useful in manufacturing a resource of the polypeptide is useful in manufacturing a resource of the polypeptide is useful in manufacturing a resource of the polypeptide is useful in manufacturing a resource of the polypeptide is useful in manufacturing a resource of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and carpivates of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polypeptides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators. The production of antibodies and in assays to identify of NOVX. The anti-NOVX polypeptide expression and activity of NOVX. Colypeptides and antagonists may also be used as antigens in the anti-NOVX polypeptide expression and activity of NOVX colypeptides. The anti-NOVX polypeptide expression and activity of NOVX colypeptides. The anti-NOVX polypeptide expression and activity of NOVX polypeptides and polynucleotide expression this way to prevent, adaptones and treat: metabolic disorders, diabetes, obesity, infectious
                                                                                                                                                                                                                                           Dipippo VA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           disease, anorexia, cancer, cancer-associated cachexia, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, disease, and the various dyslipidaemias, metabolic disturbances associated with obssity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers.

Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic and testing of codes useful for treating or develop produces for the design associated with beta-amyloid peptide, esp. Alzheimer's disease
                                                         New isolated human amyloid precursor protein protease - used to develop prods. for the treatment or diagnosis of associated conditions, esp.
